INTRODUCTION

The intent of this mounting guide is to provide the information you need to properly mount Timken® Torrington® ball, roller and needle bearings. For additional assistance please feel free to contact a Timken Authorized Distributor or sales office in your area. For your nearest Timken sales representative, call (800) 223-1954. Outside the U.S. and Canada, call (330) 438-3000.

PRODUCT INFORMATION

The Timken® Fafnir® line from The Timken Company originated the wide inner ring bearing design for ball bearings which could be easily mounted on straight shafts and positioned without shoulders, locknuts or adapters.

The internal bearing construction is basically the same as the deep race, single row radial type with ability to carry radial, thrust and combined loads, while providing low friction qualities which are characteristic of high-grade bearings. The inner ring is generally extended on both sides of the race to provide additional shaft support, and is locked to the shaft by specially designed setscrews or by the Timken-originated, eccentric self-locking collar or concentric collar. The wide inner ring bearings are also available with cylindrical or spherical outside diameters. The cylindrical or straight O.D. type is used for mounting in straight-bored housings. The spherical O.D. type must be mounted in a corresponding spherical seat and is used to compensate for shaft or housing misalignments.

FAFNIR WIDE INNER RING BEARINGS WITH LOCKING COLLARS

The following series are available with the cam (self-locking) collar.

PP Sories

These bearings feature the flareout, contact type R-seal which encloses a synthetic rubber impregnated washer between two metal caps. Most sizes incorporate the Fafnir Shroud-Seal design. R-seal wide inner ring bearings are available in the following non-relubricatable variations: KR (one seal, cylindrical O.D.), KRR and KRRB (two seals). Relubricatable versions are: G-KRR, G-KRRB and GN-KRRB (heavy-duty).

RA-RR Series

The RA-RR series features an extended inner ring and self-locking collar for simple effective shaft retention in a standard series bearing. The newly developed, positive contact, land-riding R-seal provides improved protection against the heavy contamination encountered in many applications. All sizes have a heat stabilized, moisture conditioned 6/6 nylon retainer which has proven extremely effective under conditions of misalignment.

RA-RR extended inner ring bearings are available as RA-RR (two-seals, straight O.D.) and RA-RRB (two seals, spherical O.D.). Relubricatable versions are GRA-RR and GRA-RRB.

Tri-Ply-Seal Series

Tri-Ply Seal bearings are designed for environments where severe conditions and moisture are present. The new one piece Tri-Ply seals incorporate a highly effective seal design molded to an exterior shroud cap. The shroud cap protects the seal lips from fiber wrap and abrasion while enhancing the overall sealing effectiveness of the unit. All units incorporate the self-locking collar and have a nylon retainer. Tri-ply Seal bearings are available in both a non-relubricatable (KPPB) and relubricatable version (G- KPPB).

External Self-Aligning Series

The construction of this series permits the inner assembly, which contains an open type ball bearing with spherical O.D. to align in the seat of the mating outer ring. The seat of this outer ring is matched with the spherical O.D. of the ball bearing outer ring providing unrestricted self-alignment which allows the inner assembly to become square and true with the shaft. Self-aligning units are available in both standard SM-S or heavy SMN-S series.

RA-DD Series Bearings

The new RA-DD series bearings are extended inner ring type with cam locking collars. They incorporate two close fitting non-contact grease shields to effectively retain lubricant and provide protection against harmful contaminants. The non-contact metallic shields provide improved high speed and low torque performance such as required for high speed printing press applications. The 6/6 molded nylon retainer has proven extremely effective under conditions of misalignment. These bearings are dimensionally interchangable and have the same load capacities as the RA-RR series. (Available in 5/s"-1 1/2" shaft sizes.)

WIDE INNER RING BEARINGS WITH SETSCREW LOCKING DEVICE

The following series are available with the setscrew locking device with special setscrews that are resistant to loosening during operation.

YA-RR series

The (G)YA-RR(B)series relubricatable and non-relubricatable bearings are an extended inner ring type with specially designed setscrews. Positive contact land-riding R-Seals provide protection against harmful contaminants and retain lubricant.

Setscrew Series bearings are available in both non-relubricatable version YA-RRB and relubricatable version GYA-RRB. Both types have nylon retainers.

ER Series

This series offers industry standard mounting dimensions and standard nomenclature for a large variety of sizes of relubricatable, extended inner ring bearings for through-bored housings. All bearings in this series have nylon retainers and are equipped with snap rings which eliminate the need for machining housing shoulders.

Positive contact landriding R Seals provide protection against harmful contaminants and retain lubricant. ER bearings are all black oxide coated for corrosion resistance.

RA-RR Series

External Self-Aligning Series

RA-DD Series

ER Series

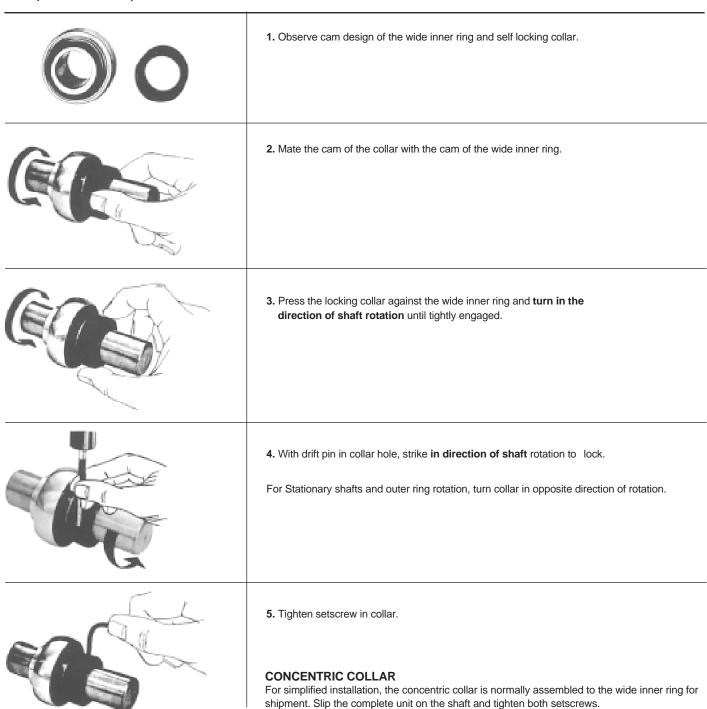

FAFNIR WIDE INNER RING BEARINGS WITH CONCENTRIC COLLARS GC-KRRB Series

The GC-KRRB wide inner ring bearings are relubricatable with spherical outside diameters, nylon retainers and shroud seals. The metal shroud maintains tight seal contact against the inner ring and shields the rubber seals from damage due to dirt or fiber wrap. The concentric collar is locked to the shaft by two setscrews, located 120° apart, which are mated with threaded holes in the collar and drilled holes in the bearing inner ring.

GC-KRRB Series

CAM (SELF-LOCKING) COLLAR

PRODUCT INFORMATION

Ball Bearing housed units, originated by Timken's own Fafnir line, are available in a wide variety of types and sizes to accommodate a complete range of operating conditions.

These units generally have cast iron housings and are designed for mounting on straight shafts with a slip fit. The self-locking collar and the setscrew inner bearing designs provide ease in mounting, bolt holes in housings take standard bolts for assembling these units to machinery frames. Several series are also available with the concentric locking collar.

As most of these units are made with a self aligning feature, it is

unnecessary for the user to refine his design in excess of practical limits. If desired, units incorporating prelubricated wide inner ring bearings may be furnished without grease fittings.

There are several basic types of housed units available: Pillow Blocks, Flanged Cartridges, Flangette Units, Cylindrical Cartridges and Take-up Units. The type required is generally determined by its application and mounting requirements. Within the basic type selected, numerous variations allow for load factors, shaft sizes, mounting surface dimensions, base to shaft center line heights and lubrication requirements.

PILLOW BLOCKS

Pillow blocks, the most commonly used type of mounted units, are designed to provide shaft support where the mounting surface is parallel to the shaft axis. The bolt holes are usually slotted for adjustment during mounting.

Pillow blocks are supplied in both standard and heavy duty series. Pressed steel and rubber pillow blocks are also available for light duty applications.

Flanged cartridges are used where a shaft passes through the machine frame at a right angle. A four bolt mounting is the most common, however, where the mounting area is restricted, three and two bolt versions are available. A piloted flanged cartridge, also available, provides additional mounting accuracy and support.

Flanged cartridges are supplied in both standard and heavy duty series. Iron and rubber flanged cartridges are also available.

A complete line of Flangette Units, pressed steel flanged cartridges, provides an economical solution to light duty applications. Two, three and four bolt mountings are available along with a relubricable version.

CYLINDRICAL CARTRIDGES

Cylindrical cartridges, like flanged cartridges, provide shaft support where the shaft axis is perpendicular to and passing through a machined housing which is generally very thick. The outside diameter of the cylindrical cartridges permits mounting with a press fit into a straight, through-bored housing.

Cylindrical cartridges have a machined spherical bearing seat to provide initial shaft alignment in standard duty applications. Synthetic, conductive rubber cylindrical cartridges are also available for applications where low cost, light duty, low noise operation is essential.

TAKE-UP UNITS

Take-up units are used where shaft adjustment and belt tightening devices are required, such as conveyor applications. Frames for take-up units provide for either side or top mounting.

Take-up units are available in cast iron for standard duty and pressed steel for economical, light duty applications.

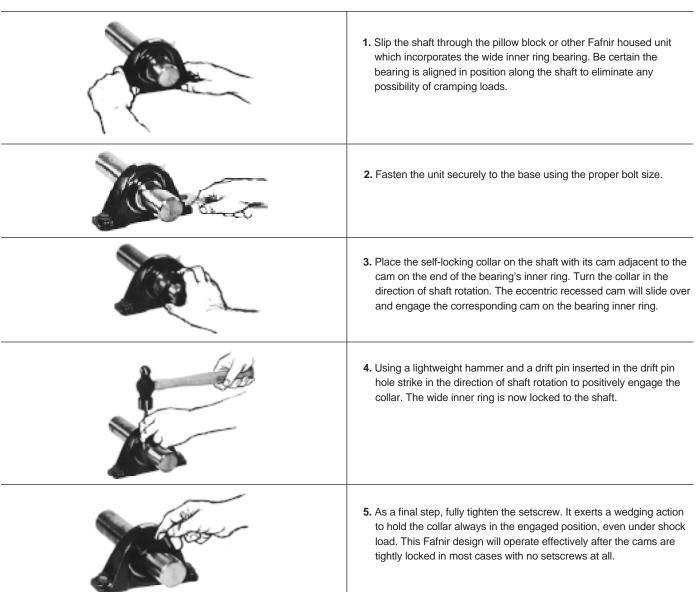

FAFNIR SELF-LOCKING COLLAR INSTALLATION

Most Timken Fafnir housed units come equipped with the self-locking collar to facilitate the mounting of wide inner ring bearings. This self-locking collar eliminates the need for locknuts, washers, shoulders, sleeves, and adapters.

The locking collar has a counterbored recess which is made purposely eccentric to the bore. The collar recess and the end of the

bearing inner ring with which it engages are both machined so that they act as mating cams when on the shaft.

When the collar is engaged to the inner ring, it grips the shaft tightly with a positive binding action that increases with use. No adjustments of any kind are necessary.

FAFNIR SETSCREW LOCKING BEARING

Steps 1 and 2 can be repeated from the Self Locking Collar Installation above. To lock the setscrew bearing, simply tighten each inner ring setscrew to the recommended torque listed by shaft size. See chart below.

		Recommended					
Shaft Size	in/mm	Torque in lbs.	(n • m)				
1/2-11/16	17 mm	35 in lbs	4 (n • m)				
³ / ₄ -1	20-25 mm	80 in lbs	9 (n • m)				
1 ¹ / ₁₆ -1 ³ / ₄	30-45 mm	155 in lbs	18 (n • m)				
1 ¹³ / ₁₆ -2 ³ / ₁₆	50-55 mm	275 in lbs	31 (n • m)				

It may be necessary to rotate the shaft to provide an easy access of the setscrew wrench to the setscrews. To disassemble, loosen the setscrews.

CONCENTRIC COLLAR

For simplified installation of Fafnir housed units equipped with concentric collar bearings, the collar is normally assembled to the wide inner ring for shipment. Slip the complete unit on the shaft following steps 1 and 2 described for the self-locking collar procedure, and tighten both setscrews.

MOUNTING PROCEDURES – TORRINGTON SPHERICAL ROLLER BEARINGS

Depending on the size of bearing and the application, there are different methods for mounting rolling bearings. In all methods, however, certain basic rules must be observed.

Cleanliness

Choose a clean environment. Work in an atmosphere free from dust or moisture. If this is not obtainable, and sometimes in the field it isn't, the installer should make every effort to insure cleanliness by use of protective screens, clean clothes. etc.

Plan the work

Know in advance what you are going to do and have all necessary tools at hand. This reduces the amount of time for the job and lessens the chance for dirt to get into the bearing.

Inspection and preparation

All component parts of the machine should be on hand and thoroughly cleaned before proceeding. Housings should be cleaned, including blowing out the oil holes. **Do not use an air hose on bearings.** If blind holes are used, insert a magnetic rod to remove metal chips that might have become lodged there during fabrication.

Shaft shoulders and spacer rings contacting the bearing should be square with the shaft axis. The shaft fillet must be small enough to clear the radius of the bearing

On original installations, all component parts should be checked against the detail specification prints for dimensional accuracy. Shaft and housing should be carefully checked for size and roundness.

Shaft and housing finish

Shaft surfaces on which the bearing will be mounted must be clean and free from nicks or burrs. For an application with stationary housing and rotating shaft, it is suggested the bearing seat on the shaft be ground to 63 RMS maximum. If it is impractical to use a ground finish, a machined finish of 125 RMS is acceptable in many cases, but the amount of interference fit should be slightly increased. Consult our Engineering Department for recommendations.

For a stationary outer ring which is required to float (i.e. slide axially in the housing), a housing surface finish of 63 RMS maximum is suggested. Where the outer ring is not required to float, a surface finish of 125 RMS maximum is generally satisfactory.

DON'T REMOVE THE BEARING FROM ITS WRAPPER UNTIL ACTUALLY READY TO MOUNT IT.

MOUNTING STRAIGHT BORE BEARINGS

Heat expansion method

Most applications require a tight interference fit on the shaft. Mounting is simplified by heating the bearing to expand it sufficiently to slide easily onto the shaft. Two methods of heating are in common use:

- 1. Tank of heated oil.
- 2. Induction heating.

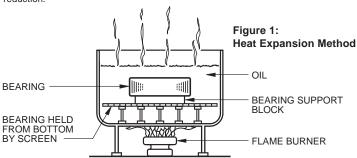

The first is accomplished by heating the bearing in a tank of oil having a **high flash** point. The oil temperature should not be allowed to exceed 250° F. A temperature of 200°F is sufficient for most applications. The bearing should be heated at this temperature, generally for 20 or 30 minutes, until it is expanded sufficiently to slide onto the shaft very easily.

The induction heating method is particularly suited for mounting small bearings in production line assembly. Induction heating is rapid, and care must be taken to prevent bearing temperature from exceeding 200° F. Trial runs with the unit and bearing are usually necessary to obtain the proper timing. Thermal crayons (such as Tempilstics*) which melt at predetermined temperatures can be used to check the bearing temperature.

While the bearing is still hot, it should be positioned squarely against the shoulder. Lockwashers and locknuts, or clamping plates, are then installed to hold the bearing against the shoulder of the shaft. As the bearing cools, the locknut or clamping plate should be tightened. In cases of outer ring rotation,

where the outer ring is a tight fit in the housing, the housing member can be expanded by heating.

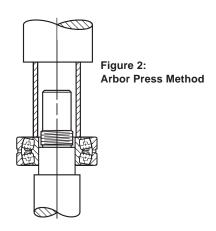

The oil bath is shown in Figure 1. The bearing should not be in direct contact with the heat source. The usual arrangement is to have a screen several inches off the bottom of the tank. Small support blocks separate the bearing from the screen. It is important to keep the bearing away from any localized high-heat source that may raise its temperature excessively, resulting in race hardness reduction.

Flame-type burners are commonly used. An automatic device for temperature control is desirable. If safety regulations prevent the use of an open heated oil bath, a mixture of 15% soluble-oil in water may be used. This mixture may be heated to a maximum temperature of about 200° F., without being flammable. The bath should be checked from time to time to insure its proper composition as the water evaporates. The bath leaves a thin film of oil on the bearing sufficient for temporary rust prevention, but normal lubrication should be supplied to the bearing as soon as possible after installation. Be sure all of the soluble-oil in water solution has been drained away from the bearing.

Arbor press method

The alternative method of mounting, generally used only on smaller sizes, is to press the bearing onto the shaft or into the housing. This can be done by using an arbor press and a mounting tube as shown in Figure 2. The tube can be of soft steel with inside diameter slightly larger than the shaft. The O.D. of the tube should not exceed the maximum shoulder height. The tube should be faced square at both ends, thoroughly clean inside and out, and long enough to clear the end of the shaft after the bearing is mounted.

If the outer ring is being pressed into the housing, the O.D. of the mounting tube should be slightly smaller than the housing bore, and the I.D. should not be less than the recommended housing shoulder diameter in the tables of dimensions.

Coat the shaft with light machine oil to reduce the force needed for the press fit. Carefully place the bearing on the shaft making sure it is square with the shaft axis. Apply steady pressure from the arbor ram to drive the bearing firmly against the shoulder.

Never attempt to make a press fit on a shaft by applying pressure to the outer ring, or a press fit in a housing by applying pressure to the inner ring.

SHAFT MOUNTING TORRINGTON TAPERED BORE SPHERICAL ROLLER BEARINGS

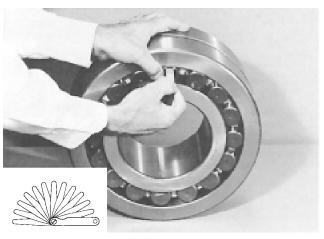

Although the fit of a tapered bore spherical roller bearing can be determined by measuring the distance the bearing is forced onto the tapered seat, it is more practical to measure the **reduction of radial internal clearance** caused by expansion of the inner ring. This procedure requires determining the **initial** RIC before mounting, and checking the RIC during mounting until the proper **reduction of RIC** has been accomplished.

To determine initial RIC, the following procedure should be observed. A feeler gauge with the thinnest blade of 0.0015" is used. Place the bearing in an upright position with inner and outer ring faces parallel. Place thumbs on the inner ring bore and oscillate inner ring two or three times, pressing down firmly. This "seats" the inner ring and rolling elements. Position the individual roller assemblies so that a roller is at the top of the inner ring – on both sides of the bearing. Press the two top rollers inward to assure proper contact with the inner ring raceways. With the rollers in correct position, insert a thin blade of the feeler gauge between the rollers. Move it carefully over the top

roller, between the roller and outer ring raceway. Repeat this procedure, using thicker feeler gauge blades, until one is found that will not go through. The blade thickness that preceded the "no-go" blade is a measure of radial internal clearance (RIC) before installation.

Determine the target value of the **reduction of RIC** following procedure outlined in the example following. Start the mounting procedure by lubricating the tapered shaft with a light coat of machine oil. Slide the bearing onto the shaft as far as it will go. As the locknut is tightened, the interference fit builds up resulting in expansion of the inner ring. Periodically measure the RIC to keep track of the **reduction in** RIC.

Continue the procedure until the proper amount of reduction is obtained do not exceed recommended amount of reduction. As a final check, make sure that the remaining RIC equals or exceeds the **minimum mounted** clearance shown on page 10.

During mounting, the RIC should be checked at the unloaded roller. If this happens to be at the bottom, make sure that the roller is raised to seat firmly on the inboard portion of the inner race.

MOUNTING

Adapters vs. Straight Bore

Usually a spherical roller bearing Pillow block assembly is mounted to a straight shaft using a tapered bore bearing and adapter assembly. Standard commercial shafting can be used without additional machining. (Recommended shaft diameters are shown on page 18-21).

Adapter mount also permits maximum flexibility in the axial positioning of the bearing on the shaft and will accommodate light locational thrust loads. Timken® Torrington® pillow blocks for tapered bore and adapter-mounted bearings are available in Series 225, 226, 230, 231K and 232K.

Adapter mounted spherical roller bearings require the correct removal of diametral clearance from the bearing to prevent relative rotation between inner race and sleeve or shaft. Failure to employ proper mounting procedures can cause heating and reduced bearing performance.

When application conditions produce heavy thrust loads or a need exists for exact axial location or a positive shaft interference fit, a direct straight bore mounting may be the best option. This requires a shouldered shaft, machined for proper fit and a straight bore bearing. Torrington pillow block assemblies for straight bore applications are available in Series 222, 223, 231, and 232.

Recommended fits for shafts in cylindrical bore spherical roller bearings are shown on pages 17 through 25. For applications involving heavy shock, vibration, unbalanced rotating loads or other abnormal conditions, consult your Timken sales associate.

Fixed and Float Pillow Blocks

Any style of Torrington pillow blocks can be easily installed either at the float or fixed position on the shaft. For the fixed position, a stabilizing ring is added between the bearing outer ring face and the housing shoulder to positively locate the shaft and prevent axial movement.

Some applications require centering of the bearing in its housing. To accomplish this, two special width stabilizing rings can be ordered.

In the float position, the ring is not used allowing the bearing to move axially (a maximum of %") to compensate for thermal expansion or contraction of the shaft.

Pillow blocks ordered by the numbers in the dimensional tables are fixed units. To order float units specify by adding suffix "Float" or "FL" to the pillow block number.

Closed End Installations

In some applications, the shaft end is designed to terminate inside the pillow block. For such a design, positive fitting end-closure inserts are available to seal out contaminants and retain lubricants. Torrington heavy-duty end plugs include O-rings for positive sealing.

Designers and installers need to make sure the shaft end does not contact the closure. A minimum of 1/6" clearance at maximum thermal expansion is recommended between the end of the shaft and the closure. Dimension "Y" in the product catalog tables defines the maximum permissible length of the shaft from center line of the pillow block housing. If end closure is desired, specify by adding "CL" (one end closed) to the pillow block assembly number.

In the manufacture of ball bearings, it is standard practice to assemble rings and balls with a specified internal clearance. This characteristic is necessary to absorb the effect of press fitting the bearing rings at mounting

Internal clearances sometimes are utilized to compensate for thermal expansion of bearings, shafts and housings or to provide a contact angle in the bearing after mounting.

Internal clearance can be measured either by gauging radially or axially.

Radial measurement is accepted as the more significant characteristic because it is more directly related to shaft and housing fits. It also is the method prescribed by the American Bearing Manufacturers Association (ABMA).

Radial Internal Clearance

The radial internal clearance of a radial contact ball bearing can be defined as the average outer ring raceway diameter minus the average inner ring raceway diameter minus twice the ball diameter.

Radial internal clearance can be measured mechanically by moving the outer ring horizontally as pictured in Figure 1. The total movement of the outer ring when the balls are properly seated in the raceways determines the radial internal clearance. Several readings should be taken using different circumferential orientations of the rings in order to get a comprehensive average reading.

Fafnir radial clearance designations correlate with ABMA symbols as follows:

Fafnir Bearing Number Prefix	ABMA Symbol	Description
н	2	Snug fit; slight internal clearance; sometimes used to achieve a minimum of radial or axial play in an assembly, Example: H204K
R	0	Medium fit; internal clearance generally satisfactory with recommended shaft and housing fits shown on pages 26-30. Example: RMM204K.
Р	3	Loose fit; considerable internal clearance required for applications involving press fits on both inner and outer rings, extra interference fits, or temperature differentials. Example: P204K.
J	4	Extra Loose fit; large amount of internal clearance for applications involving large interference fits or temperature differentials. Example: J204K.
IJ	5	Extra-Extra Loose fit; extra large amount of internal clearance for applications with large temperature differential and interference fits on both rings.

End play

End play is an alternate method of measuring internal clearance and is rarely used except for certain special applications. End play is determined by mounting the bearing, as shown in Figure 2, with one of its rings clamped to prevent axial movement. A reversing measuring load is applied to the unclamped ring so that the resultant movement of that ring is parallel to the bearing axis. End play is the total movement of the unclamped ring when the load is applied first in one direction and then in the other.

When the inner and outer ring raceway curvatures are accurately known, the free end play can readily be calculated from the values of no load radial clearance by the following formula:

$$E = \sqrt{4dR_D(K_O + K_i - 1) - R_D^2} \text{ or } \cong \sqrt{4dR_D(K_O + K_i - 1)}$$

Where R_{D}^2 is generally a very small value and can be omitted for most calculations without introducing undue inaccuracy.

E = Free end play where

 $K_{\text{O}} = \,$ outer race contour radius expressed as a decimal fraction of the ball diameter.

 $\mathsf{K}_i = \mathsf{inner}$ race contour radius expressed as a decimal fraction of the ball diameter

R_D = radial clearance (no load)

d = ball diameter

Contact Angle

The contact angle (α) is related to internal clearance as follows:

$$\alpha = \sin^{-1} \left(\frac{E}{2 (Ko + Ki - 1)d} \right)$$

The contact angle (α) may also be accurately determined in a production bearing from its pitch diameter (P.D.) and by measuring the number of revolutions (N_c) of the ball and cage assembly relative to rotation (N_i) of the inner ring under a light thrust load.

$$(N_c) = .5N_i(1 - \frac{d}{P.D.}\cos\alpha)$$

$$\cos \alpha = \frac{P.D.}{d}$$
 $\left(1 - \frac{N_c}{.5N_i}\right)$

The accuracy of this method of measurement depends greatly upon the care taken in set-up. Balanced weight for thrust loading, vertical truing, slow turning, many turns, minimum lubricant of low viscosity and prerotation are all essential for instance. The races should not be radially restrained during the contact angle measurement.

TORRINGTON RADIAL SPHERICAL ROLLER BEARINGS

Radial Internal Clearance (RIC) is the radial play within a bearing. Torrington bearing RIC's allow a tight fit, with sufficient internal clearance after installation for normal operating conditions.

Spherical Roller Bearings with tapered bore (K) require a slightly greater interference fit on the shaft than would a cylindrical bore bearing. The effect of this greater interference fit is a reduction of RIC. For tapered bore bearings, it is critical to select the RIC that allows for this reduction.

For example, bearing number 22328K C3 (140 mm bore with C3 clearance) is to be mounted on a tapered shaft. By feeler gauging, RIC is found to be 0.007" (0.178mm). The chart indicates that the proper fit will be obtained when RIC is reduced by 0.0025" to 0.0035" (0.064 to 0.089 mm). Clearance after mounting is computed: 0.007"-

0.003"= 0.004" (0.178-0.076=0.102mm). The locknut should be tightened until RIC reaches 0.004" (0.102mm).

Several factors influence RIC reduction. Inner rings pressed into solid steel shafts expand approximately 80% of the interference fit. Outer rings pressed into steel or cast iron housings reduce RIC by about 60%, of the interference fit. For RIC reduction on hollow shafts or non-steel materials consult Timken sales engineers.

Torrington bearings are supplied with NORMAL RIC, unless otherwise specified. The desired RIC code must be added to the bearing number, FOLLOWING ALL OTHER SUFFIXES.

Min./max. values for each RIC are shown in the two adjacent columns directly beneath the selected RIC. For example, the minimum values shown for C5 are also the maximum values for C4; minimum values for C4 are also the maximum values for C3; etc.

TORRINGTON RADIAL TAPERED ROLLER BEARINGS – TWO ROW

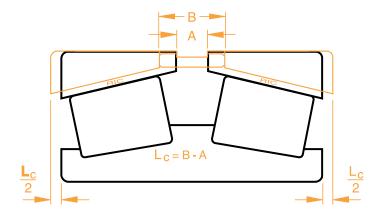

In two row tapered roller bearings, Internal Clearance is usually defined as Lateral Clearance ($L_{\rm C}$) or end play, which is related to Radial Internal Clearance (RIC) by the formula:

$$L_{C} = \frac{RIC X K}{0.39}$$

K being a thrust factor which is different for every bearing and is included in the table of dimensions.

 L_{C} is determined by the relative axial position of cup and cone, and is a function of spacer width in the two element member (cup or cone). In the illustration, the cups shown in black are positioned for zero RIC, allowing no end play. The cups shown in green provide lateral clearance equal to (B-A).

The desired $L_{\rm C}$ must be specified by adding designation codes G1, G2, etc. to the bearing number, FOLLOWING ALL OTHER SUFFIXES.

INSTALLATION OF TORRINGTON DRAWN CUP BEARINGS

INSTALLATION PROCEDURES

A drawn cup bearing must be pressed into its housing. An installation tool similar to the one illustrated must be used in conjunction with a standard press.

It is advisable to utilize a positive stop on the press tool to locate the bearing properly in the housing. The assembly tool should have a leader or pilot, as shown, to aid in starting the bearing true in the housing.

The installation tool must be coaxial with the housing bore. The ball detent shown on the drawing is used to assist in aligning the rollers of a full complement bearing during installation and to hold the bearing on the installation tool.

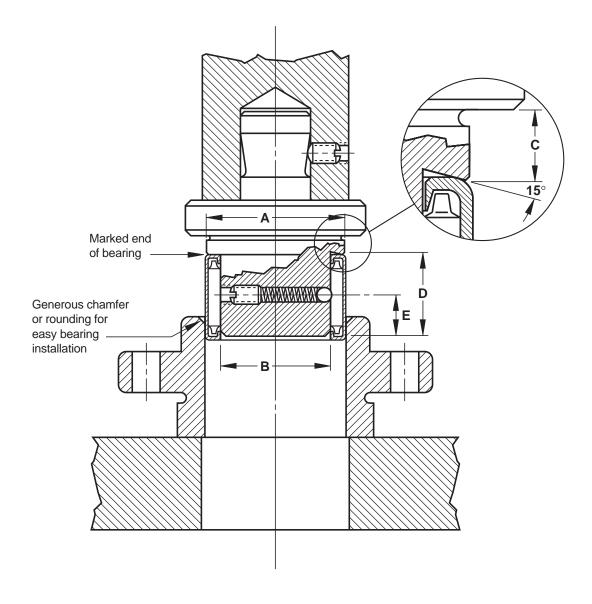

Assemble the bearing with the marked end (the end with identification markings) against the angled shoulder of the pressing tool.

Never hammer the bearing into its housing even in conjunction with the proper assembly mandrel.

Never press the bearing tightly against a shoulder in the housing. If it is necessary to use a shouldered housing, the depth of the housing bore must be sufficient to ensure the housing shoulder fillet, as well as the shoulder face, clears the bearing.

To remove a drawn cup bearing from a through-bored housing, use a tool similar to the installation tool illustrated, but without the stop. For suggested methods of removing bearings from blind and shouldered bores, consult your Timken sales associate.

- A- 1/64" (0.4 mm) less than housing bore
- B- .003" (0.08 mm) less than shaft diameter
- **C** distance bearing will be inset into housing, minimum of .008" (0.2 mm)
- **D** pilot length should be length of bearing less ½2" (0.8 mm)
- E- approximately ½ D

HOW TO INSPECT A JOURNAL OR BORE

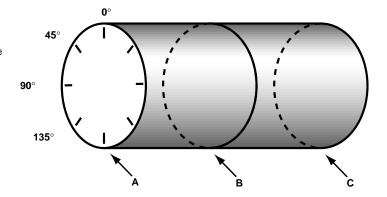

HOW TO INSPECT A BEARING JOURNAL OR HOUSING BORE

A twelve-point inspection is recommended to properly inspect a bearing journal or housing bore. Verification of mating component geometry is achieved by comparing the inspection measurements to the recommended (mating component) tolerance limits. Shaft and housing limits are selected using specific application criteria. Tables of these limits are published in The Timken Service Catalog, order no. 5731.

Diameter (size), roundness and taper (form) can be confirmed after the twelve measurements are recorded.

THE TWELVE-POINT MEASUREMENT PROCEDURE:

- Use two-point gauges that are accurate to .0001". It is recommended that gauges with accuracy to ½0 of the units that are being inspected to be used (resolution to .00001"). We recognize readily available gauges read to .0001", however.
- 2) Measure four position at 0°, 45°, 90°, and 135° in three different planes of the mating surface (that is in direct contact with the bearing). The three planes should be evenly spaced across the contact area. The outboard measurements should be ½" to ½" in from each end.
- Record the measurements on a chart like the one listed below.
 Keep all three sets of measurements oriented with respect to each other. Take an average of each plane.

	0 °	45°	90°	135°	AVERAGES
PLANE A					A =
PLANE B					B =
PLANE C					C =

DIAMETER (SIZE) EVALUATION:

Compare the average diameter measurement (A, B, C) to the recommended tolerance limits. Each average diameter should be within the recommended limits. The mating component diameter is out of specification if any average is over or under the recommended limits.

ROUNDNESS (FORM) EVALUATION:

Compare the individual measurements in a lane to each other. The maximum permissible deviation of these measurements is one-half ($\frac{1}{2}$) of the recommended limit. An out-of-round condition exists if differences greater than one-half ($\frac{1}{2}$) of the limit are found.

HOW TO INSPECT A JOURNAL OR BORE

TWELVE POINT MEASURE	MENT WORKS	SHEET			
Application:			Machine:		
Comments:

Housing Tolerances Require	ed: Max:	Min:	½ Li	imit:	
MEASUREMENTS (gauges	accurate to .000	01" minimum is recom	mended)		
_	0 °	45 °	90°	135°	AVERAGES
PLANE A					A =
PLANE B					B =
PLANE C					C =
DIAMETER (SIZE) EVALUATION	ON:		ROUNDNESS (FO	ORM) EVALUATION:	
Compare the average diameter recommended tolerance limits. within the recommended limits. of specification if any average is limits.	Each average dia	meter should be onent diameter is out	maximum permiss (½) of the recomm	ridual measurements in a sible deviation of these meanded limit. An out-of-rour than one-half (½) of the	easurements is one-half and condition exists if
TAPER (FORM) EVALUATI Taper is determined by taking the		veen the plane averages	as follows:		
AVERAGE A	=	AVERAGE B =		AVERAGE A =	
– AVERAGE B	=	AVERAGE C = .		– AVERAGE C =	
DIFFERENCE	=	DIFFERENCE =		DIFFERENCE =	
Excessive taper exists if the res	ultant differences	exceed one-half (½) of t	he specified tolerand	ce range.	

SURFACE FINISH REFERENCE:

- · Common surface finishes required for shafts are:
 - ≤ 2" diameter = 32rms Micro Finish maximum
 - > 2" diameter = 63rms Micro Finish maximum
- Common surface finishes required for housings are:
 Stationary outer ring required to float = 63rms maximum
 Stationary outer ring not required to float = 125rms maximum

HOW TO INSPECT A JOURNAL OR BORE

EXAMPLE:

A 22324YMW33W800C4 "shaker screen" bearing housing inspection. This application requires a "P6" housing tolerance limit. The "P6" housing diameters are 10.2331"/ 10.2343".

Size is verified when the housing "plane" average diameters are between 10.2331" and 10.2343".

Roundness and taper inspections require that one-half ($\frac{1}{2}$) of the permissible tolerance limits be calculated. Thus,

Roundness is verified by comparing the differences of the four measurements of a given plane. **No** difference should exceed .0006".

Taper is verified by comparing the differences of the three **averages**. No difference should exceed .0006".

CONCLUDING COMMENTS:

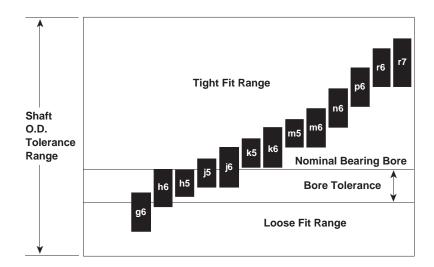

Precision ground anti-friction, rolling element bearings are extremely precise and refined industrial products. Their performance and life can be greatly enhanced by the following:

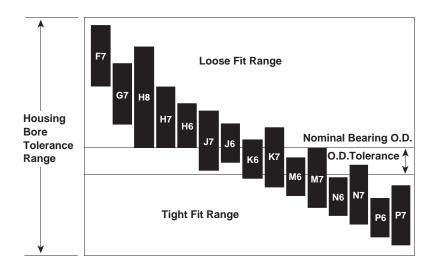

- · The working environment must be clean during installation.
- Accepted care, handling techniques, and tools and fixtures must be employed during removal and installation of bearings during repair.
- Mating component geometry and material should meet industry standards as published in The Timken Service Catalog.
- · Common surface finishes required for shafts are:
 - ≤ 2" diameter = 32rms Micro Finish maximum
 - > 2" diameter = 63rms Micro Finish maximum
- Common surface finishes required for housings are:
 Stationary outer ring required to float = 63rms maximum

 Stationary outer ring not required to float = 125rms maximum

RADIAL BALL, SPHERICAL, CYLINDRICAL ROLLER BEARINGS

Below is a graphical representation of shaft and housing fit selection for these bearings conforming to ANSI/ABMA Standard 7. The bars designated by g6, h6 etc. represent shaft/housing diameter and tolerance ranges to achieve various loose and interference fits required for various load and ring rotation conditions.

RADIAL BALL, SPHERICAL AND CYLINDRICAL ROLLER BEARINGS

Tolerance and shaft diameters shown as variance from nominal bearing bore, using the symbols in the graph. All data except nominal dimensions are in ten-thousands of an inch (5 = 0.0005") and thousandths of a millimeter or micrometer (5 = 0.005mm).

See pages 26 through 31 for actual shaft and housing diameters for normal loading of ABEC-1 and ABEC-3 radial ball bearings and 7000WN Series angular contact ball bearings.

For particular operating conditions of radial ball, spherical and cylindrical roller bearings, see pages 32, 33 and 34.

RADIAL BALL, SPHERICAL AND CYLINDRICAL ROLLER BEARINGS (continued)

Tolerance and shaft diameters shown as variance from nominal bearing bore, using the symbols in the graph. All data except nominal dimensions are in ten-thousands of an inch (5 = 0.0005) and thousandths of a millimeter or micrometer (5 = 0.005)mm).

See pages 26 through 31 for actual shaft and housing diameters

for normal loading of ABEC-1 and ABEC-3 radial ball bearings and 7000WN Series angular contact ball bearings.

For particular operating conditions of radial ball, spherical and cylindrical roller bearings, see pages 32, 33 and 34.

The tolerances in this table are in conformance with ANSI/ABMA Standard 7– 1988.

RADIAL BALL, SPHERICAL AND CYLINDRICAL ROLLER BEARINGS

Tolerance and housing bore shown as variance from nominal bearing O.D. All data except nominal dimensions are in ten-thousands of an inch (5 = 0.0005") and thousandths of a millimeter or micrometer (5 = 0.005mm).

See pages 26 through 31 for actual shaft and housing diameters

for normal loading of ABEC-1 and ABEC-3 radial ball bearings and 7000WN Series angular contact ball bearings.

For particular operating conditions of radial ball, spherical and cylindrical roller bearings, see pages 32, 33 and 34.

The tolerances in this table are in conformance with ANSI/ABMA Standard 7– 1988.

RADIAL BALL, SPHERICAL AND CYLINDRICAL ROLLER BEARINGS

Tolerance and housing bore shown as variance from nominal bearing O.D. All data except nominal dimensions are in ten-thousands of an inch (5 = 0.0005") and thousandths of a millimeter or micrometer (5 = 0.005mm).

See pages 26 through 31 for actual shaft and housing diameters

for normal loading of ABEC-1 and ABEC-3 radial ball bearings and 7000WN Series angular contact ball bearings.

For particular operating conditions of radial ball, spherical and cylindrical roller bearings, see pages 32, 33 and 34.

The tolerances in this table are in conformance with ANSI/ABMA Standard 7 - 1988.

ABEC-1 AND ABEC-3 BALL BEARINGS

Shaft and Housing Fits

The tables on the following pages show information supplemental to and coherent with that found on pages 17 through 25 as applied to ball bearings. Actual shaft and housing diameters are listed for ABEC-1, ABEC-3 and angular contact 7000WN series. These recommendations can be used for most applications having light to normal loads. Shaft and housing fits for wide inner ring ball bearings are found on page 44.

ABEC-7 BALL BEARINGS

Shaft fits:

As a general rule, it is recommended that the shaft size and tolerance for seating ABEC-7 superprecision bearings be the same as the bearing bore thus producing an average line-to-line fit. For larger shaft sizes the average fit increases to a slight interference.

Example:

Bore Size, Inches	Shaft Diameter, Inches	Resultant Mounting Fits, Inches	Average Fit
max. 2.1654	min. 2.1652	.0002 tight	line-to-line
min. 2.1652	max. 2.1654	.0002 loose	iine-to-iine

Housing fits;

Under normal conditions of rotating shaft, the outer ring is stationary and should be mounted with a hand push or light tapping fit. Should the housing be the rotating member, the same fundamental considerations apply in mounting the outer race as in the case of an inner ring omunted on a rotating shaft.

As a general rule, the minimum housing bore dimensions for superprecision bearings may be established as the same as the maximum bearing outside diameter. If the bearing O.D. tolerance is .0003 inch, the maximum housing bore should be established as .0003 inch larger than the minimum housing bore dimension.

Example:

0	utside Diameter, Inches	Housing Bore, Inches	Resultant Mounting Fits, Inches	Average Fit, Inches
	max. 3.5433	min. 3.5433	.0000 tight	.0003 loose
	min. 3.5430	max. 3.5436	.0006 loose	.0003 10058

On high-speed applications, it is extremely important that the floating bearing or pair can move axially to compensate for thermal changes. It cannot float laterally if restricted by a tight housing bore or by the radial expansion of the bearing itself. Cases involving unusual conditions should be submitted to Timken Engineering for complete recommendations.

It is equally important that all shaft and housing shoulders be absolutely square, and that the faces of the spacers be square and parallel.

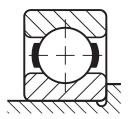

SELECTIVE ASSEMBLY

Under certain conditions it may be desirable to control fits more accurately without the added expense of using closer-tolerence bearings and mating parts. This can be accomplished by selective assembly of bearings, shafts and housings after they have been sized and grouped according to bores and outside diameters. Generally, however, it is more satisfactory for production and servicing to use closer shaft and housing tolerences with bearings having a higher degree of precision.

Bearings with coded bores and O.D.'s are available on special order to facilitate this selective assembly process.

SHAFTS AND HOUSING FILLETS

The recommended shaft and housing fillet radii listed in the dimension tables of the product catalogs should be used to assure proper seating of the bearings against shaft and housing shoulders. The manufacturing tolerences on bearing corner radii are such that the corners will clear the cataloged fillet radii when the bearings are tightly seated against shoulders. Shaft and housing radii and shoulders should be free from nicks and burrs. Whenever possible, undercutting of bearing seats and adjacent shoulders per figure below is advisable to help avoid tapered bearing seats, and assure clearing corners.

FINISH OF SHAFTS AND HOUSINGS

For ABEC-1 bearing applications shaft finish should be 32 micro inches AA maximum regardless of size.

These figures are to be used as a guide only. Special situations may demand better finishes.

SHAFT FITS, ABEC-1, ABEC-3

NOTE: These tables are to used for applications where only one ring (either inner or outer) has an interference fit with its shaft and housing. The guidelines for operating conditions covering these tables are found on page 32. In cases where interference fits are used for both rings, bearings with a special internal clearance may be required. Shaft diameter dimensions are for solid steel shafts. Consult The Timken Company when using hollow shafts.

SHAFT FITS, 7000 WN

NOTE: These tables are to be used for applications where only one ring (either inner or outer) has an interference fit with its shaft and housing. The guidelines for operating conditions covering these tables are found on page 32. In cases where interference fits are used for both rings, bearings with a special internal clearance may be required. Shaft diameter dimensions are for solid steel shafts. Consult The Timken Company when using hollow shafts.

SHAFT FITS, 7000 WN Single Row Angular Contact Bearings

These diameters result in shaft to bearing bore fit which closely conforms to j5 listed on pages 18 and 20.

HOUSING FITS, ABEC-1, ABEC-3

NOTE: These tables are to used for applications where only one ring (either inner or outer) has an interference fit with its shaft and housing. The guidelines for operating conditions covering these tables are found on page 32. In cases where interference fits are used for both rings, bearings with a special internal clearance may be required. Shaft diameter dimensions are for solid steel shafts. Consult The Timken Company when using hollow shafts.

These diameters result in a bearing O.D. to
housing bore fit which closely conforms to
H6 listed on pages 22 and 24.

These diameters result in a bearing O.D. to housing bore fit which closely conforms to

0	C _e	j6 ⁽³⁾	Pure thrust loads	All			Not reco	nmended, consu	It Timken sales off	ice.	

⁽¹⁾ For solid shaft. See pages 18, 19, 20, and 21 for numerical values.
(2) Use J5 for accurate applications.
(3) Bearings with greater than nominal clearance must be used.
(4) Use k5 for accurate applications.

* Below this line, housing can either be one – piece or split; above this line, a split housing is

not recommended.

HOUSING

	Operating Conditions	Examples Tolerence Symbol ⁽¹⁾	Housing Displaceable Axially	Outer Ring		
		OUTER RING ROTATING				
Heavy I	loads with thin-wall housing	Crane support wheels Wheel hubs (roller bearings) Crank bearings	P6	No		
Normal	I to heavy loads	Wheel hubs (ball bearings) Crank bearings	N6	No		
Light Io	pads	Conveyor rollers Rope sheaves Tension pulleys	M6	No		
		INDETERMINATE LOAD DIRECTION	I			
Heavy s	shock loads	Electric traction motors	M7	No		
	l to heavy loads, axial displacement r ring not required.	Electric motors Pumps Crankshaft main bearings	К6	no, normally		
Light to	o normal loads, axial displacement r ring desired.	Electric motors Pumps Crankshaft main bearings	J6	Yes, normally		
		OUTER RING STATIONARY				
Shock I	loads, temporary complete unloading	Heavy rail vehicles	J6	Yes, normally		
All loads	One-piece housing	General applications Heavy rail vehicles	H6	Easily		
	Radially split housing	Transmission drives	H7	Easily		
Heat su	upplied through shaft	Dryer cylinders	G7	Easily		

 $^{^{(5)}}$ Use m5 for accurate applications. $^{(6)}$ C = Dynamic Load Rating. $^{(7)}$ C $_{\rm e}$ = Extended Dynamic Load Rating (Ball Bearings).

⁽¹⁾ Cast iron steel housing. See pages 22,23, 24 and 25 for numerical values.

Where wider tolerances are permissible, P7, N7, M7, K7, J7 and H7 values may be used in place of P6, N6, M6, K6, J6, and H6 values respectively.

RADIAL SPHERICAL ROLLER BEARINGS

These charts are guidelines for specifying shaft and housing fits related to particular operating conditions.

	All loads	Applications in general	All diameters		See tables for Reduction of RIC on page

⁽¹⁾For solid steel shaft. See tables on pages 18, 19, 20, and 21 for numerical value.

s4 FITS

A centrifugal force load produces a rotating outer ring load and a stationary inner ring load, even though the inner ring rotates. This makes it desirable to fit the outer ring tight in the housing (using a P6 fit as shown on page 24), and the inner ring loose on the shaft using an s4 fit as listed in the table. The standard W33 bearing with oil groove and oil holes can be used.

Data shown in ten-thousandths of an inch (6=.0006") or thousandths of a millimeter (15=0.015 mm.). See dimensional tables for nominal bore.

SHAFT AND HOUSING FITS

RADIAL SPHERICAL ROLLER BEARINGS

This chart is a guideline for specifying housing fits for particular operating conditions.

HOUSING

	Co	nditions	Examples	Tolerance Symbol ⁽²⁾	Remarks
		Variable load direction	Two-bearing shaft mechanism	P6	
	Rotating outer	Heavy loads on bearings in thin walled housings	Supporting wheels in cranes, wheel hubs, crank bearings	P7	
One piece	ring load	Normal and heavy loads	Wheel hubs, crank bearings	N7	The outer ring is not displaceable axially
bearing housing		Light and variable loads	Conveyor rollers, rope sheaves, tension pulleys	M7	
		Heavy shock loads	Electrical traction motors		
	Indeterminate load direction	Heavy and normal loads, axial displacement of outer ring not required	Electrical motors, pumps, crankshaft main bearings	К7	The outer ring is, as a rule, not displaceable axially.
		Normal and light loads, axial displacement of the outer ring desirable	Electrical motors, pumps, crankshaft main bearings	J7	The outer ring is, as a rule,
Split or one		Shock loads, temporarily complete unloading	Journal boxes for rail vehicles		displaceable axially.
piece bearing housing	Stationary outer	All loads	Bearing applications in general, journal boxes for rail vehicles	Н7	
	ring load	Normal and light loads, loads under simple operating conditions	Line shaftings	Н8	The outer ring is easily displaced axially.
		Heat supplied through the shaft	Dryer cylinders	G7	
	Applications	Very accurate running and small deflections under variable loads	For main O.D. less than 125mm spindles O.D. 125 to 250 mm in machine O.D. over 250mm tools	M6 N6 P6	The outer ring is not displaceable axially
One piece bearing housing	requiring particular accuracy	Very accurate running under light loads and indeterminate load direction	Held bearings in high speed centrifugal force compressors	K6	The outer ring is, as a rule, not displaceable axially.
		Very accurate running, axial displacement of outer ring desirable	Floating bearings in high speed centrifugal force compressors	J6	The outer ring is easily displaced axially.

⁽²⁾ Cast iron or steel housing. For numerical values see tables on pages 22, 23,24, and 25. For housings of light metal, tolerances generally are selected which give a slightly tighter fit than those given in the table.

RADIAL TAPERED ROLLER BEARINGS

Tolerences, shaft diameters and housing bores are shown as variances from the nominal bearing dimension. All data except nominal dimensions are in ten-thousandths of an inch (5=0.0005) and thousandths of a millimeter or micrometers (5=0.005mm).

Shaft and housing data shown in inches over millimeters.

Shaft and housing shoulder diameters for radial roller and thrust ball and thrust ball and roller bearings are also found in the respective dimension tables. Shaft and Housing shoulders for ball bearings are shown below.

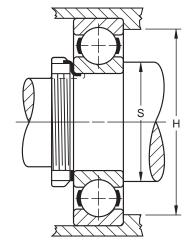

FAFNIR RADIAL BALL BEARINGS

The preferred method of locating bearings on shafts and in housings is to provide accurate shoulders perpendicular to the shaft axis. Shoulders should be large enough to exceed the theoretical point of tangency between the corner radius and the face of the bearing, and small enough to permit bearing removal with proper pullers.

These tables give the recommended maximum and minimum shaft and housing shoulder diameters for the majority of applications. Where design limitations do not permit conformance to these recommended diameters, the Engineering department should be consulted.

Recommended shaft and housing fillet radii are listed in the dimensional tables of each product catalog and must be used to assure proper seating against shaft and housing shoulders.

Shaft and housing diameters for radial ball bearings are shown below and on the following two pages. For radial cylindrical, spherical and tapered roller bearings refer to the respective dimension tables. Housing shoulders for wide inner ring bearings are shown on page 44.

EYTDA-SMALL SEDIES

SHAFT DESIGN - TORRINGTON NEEDLE BEARINGS

When the shaft is used as the inner raceway for needle roller bearings the following specifications must be met:

metallurgy – either case hardening or through hardening grades
of good bearing quality steel are satisfactory for raceways. Steels
which are modified for free machining, such as those high in sulfur
content and particularly those containing lead, are seldom
satisfactory for raceways.

To realize full bearing capacity, the raceway area must be at least surface hard with a reasonable core strength. The preferred surface hardness is equivalent to 58 HRC. If the raceway is of lesser hardness, see the modification factors shown in Tables 2 and 3.

Shaft raceways for all needle roller bearings, in diameters up to 3.5 inches or 90mm should have an effective case depth of 0.030 inch or 0.8mm. (Effective case depth is defined as the distance from the surface, after final grinding, to the 50 HRC hardness level.) For raceways larger than 3.5 inches or 90 mm in diameter the effective case depth should be 0.050 inch or 1.3 mm.

- strength the shaft must be of sufficient size to keep the operating deflections within limits.
- **3. tolerance** the recommended shaft diameter tolerances for each type of needle roller bearing are indicated on the tabular pages.
- **4. taper** the taper within the length of the bearing raceway should not exceed 0.0003 inch (0.008 mm), or one-half the diameter tolerance, whichever is smaller.
- 5. out-of-roundness the radial deviation from true circular form of the raceway should not exceed .0001 inch (0.0025mm) for diameters up to and including 1.0 inch (25mm). For raceways greater than 1.0 inch or 25mm the allowable radial deviation may be greater than .0001 inch (0.0025mm) by a factor of raceway diameter (in inches) divided by 1.0 or a factor of raceway diameter (in mm) divided by 25.
- 6. surface finish the raceway finish should not exceed 8 micro-inches aa (arithmetic average) or 0,2 μm (on the Ra scale). In addition, the raceway area must be free of nicks, scratches and dents. Oil holes are permissible in the raceway area but care must be taken to blend the edges gently into the raceway.

Care must be taken to prevent grind reliefs, fillets, etc., from extending into the raceway area. If the rollers overhang a grind relief or step on the shaft, there will be high stress concentration with resultant early failure.

- 7. end chamfer for most effective assembly of the shaft into a bearing, the end of the shaft should have a large chamfer or rounding. This should help in preventing damage to the roller complement, scratching of the raceway surface and nicking of the shaft end.
- 8. sealing surface in some instances bearings have integral or immediately adjacent seals that operate on the surface ground for the bearing raceway. Here, particular attention should be paid to the pattern of the shaft finish. In no instance should there be a "lead", or spiral effect, as often occurs with through feed centerless grinding. Such a "lead" may pump lubricant past the seal.

When it is undesirable or impractical to prepare the shaft to be used as a raceway, inner rings are available as listed in the tabular pages. If the shaft is not used directly as a raceway, the following design specifications must be met:

- strength the shaft must be of sufficient size to keep the operating deflections within limits.
- 2. tolerance the recommended shaft diameter tolerances for mounting inner rings are indicated on the tabular pages.
- 3. taper and out-of-roundness the taper and out-of-roundness should not exceed one-half the shaft diameter tolerance.
- **4. surface finish** the surface finish should not exceed 125 microinches, aa (arithmetic average) or 3.2 μm (on the Ra scale).
- locating shoulders or steps locating shoulders or steps in the shaft must be held to close concentricity with the bearing seat to prevent imbalance and resultant vibrations.

HOUSING DESIGN - TORRINGTON NEEDLE BEARINGS

BEARINGS WITH OUTER RINGS

For bearings with outer rings the function of the housing is to locate and support the outer ring. The following specifications must be met:

- **1. strength** housings should be designed so that the radial loads which will be placed on the bearings will cause a minimum of deflection or distortion of the housing.
- **2. tolerance** the recommended housing bore tolerances for each type of needle roller bearing are indicated on the tabular pages.
- **3.** taper the taper within the length of the outer ring should not exceed .0005 inch (0.013 mm).
- **4.out-of-roundness** the housing bore should be round within one-half the housing bore diameter tolerance.
- **5. parallelism** when possible, line bore housings which are common to one shaft to obtain parallelism of the housing bores and the shaft axis.
- **6. surface finish** the surface finish of housing bore should not exceed 125 microinches, aa (arithmetic average) or 3.2 μ m (on the Ra scale).
- **7. end chamfer** to permit easy introduction of the bearing into the housing, the end of the housing should have a generous chamfer.

Heavy duty roller bearings can be installed into housings with a transition fit or a clearance fit. The outer ring should be a transition fit in the housing when it rotates relative with the load. The outer ring may be a clearance fit in the housing when it is stationary relative to the load. In either case, locate the bearings by shoulders, or other locating devises, to prevent axial movement.

Since the heavy duty roller bearing does not require an interference fit in the housing to round and size it properly, a split housing may be used if desired. Dowels should be used to maintain proper register of the housing sections.

Drawn cup bearings have a thin case-hardened outer ring which is out-of-round from the hardening operation. For proper mounting it must always be pressed into the housing. Split housing will not round and size a drawn cup bearing. When split housings must be used, the bearing should first be mounted in a cylindrical sleeve.

The housing should be of sufficient tensile strength and section to round and size the bearing. It must be designed for minimum distortion under load. Steel or cast iron housings are preferred. Housing bores in low tensile strength materials such as aluminum, magnesium, phenolics, etc., should be reduced to provide more interference fit. Thin section cast iron and steel housings may also require reduced bores. Consult The Timken Company for recommendations when working with these lower strength housings.

The housing should be through bored if possible. When shouldered housing bores are unavoidable, the bearing should be located far enough from the shoulder to avoid the danger of crushing the end of the drawn cup during installation.

When the drawn cup bearing is mounted close to the housing face, care should be taken to mount the bearing at least 0.008 inch (0.20 mm) within the housing face to protect the bearing lip.

BEARINGS WITHOUT OUTER RINGS

In many cases, such as with gear bores, it is desirable to have the housing bore serve as the outer raceway for caged needle roller assemblies or loose needle roller complements. In those instances, the following specifications must be met:

- strength the housing must be of sufficient cross section to maintain proper roundness and running clearance under the maximum load.
- metallurgical material selection, hardness and case depth should be consistent with the requirements for inner raceways given in the SHAFT DESIGN recommendations on page 40.
- 3. taper and out-of-roundness the raceway out-of-roundness and taper should not exceed 0.0003 inch (0.008 mm) or one-half the bore tolerance, whichever is smaller. In addition, the bore diameter must never be smaller at both ends than in the center (sway-back).
- 4. surface finish the raceway surface finish should not exceed 8 microinches, aa (arithmetic average) or 0.2 μm (on the Ra scale). In addition, the surface must be free of nicks, dents and scratches.
- 5. grind reliefs care must be exercised to ensure that grind reliefes, fillets, etc. do not extend to the raceway. Oil holes in the raceway area are permissible but the edges must be blended smoothly with the raceway.

Housing shoulder diameters of bearings with Mechani-Seals differ slightly from those of other types to allow for clearance between the external rotating member of the seal and the housing shoulder.

SHAFT AND HOUSING SHOULDERS

FAFNIR WIDE INNER RING BALL BEARINGS

When shafts are selected for use with wide inner ring bearings, a minimum slip fit is very desirable for the most satisfactory mounting. Special shaft limits are required in certain cases, and a variety of standard fits can be used, even including a press fit. The recommended figures are noted below. In some applications it may be permissable to use increased shaft tolerances. In such cases, applications should be forwarded to our The Timken Company for complete recommendations.

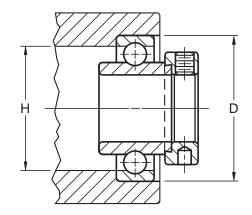

Bearing bore tolerance: $^1\!/_2"$ - 2 $^3\!/_6"$ = nominal to +.0005, + .013mm;

2 $^1\!/_4$ " - 3 $^3\!/_16$ " = nominal to +.0006",+.015mm;

3 7/16" - 115/16" = nominal to +.0007",+.018mm

Recommended shaft tolerances: ½" - 1 15/16" = nominal to -.0005", -.013mm;

2" - 3 $^{15}/_{16}$ " = nominal to -.0010", -.025mm.

HYDRAULIC NUTS

INTRODUCTION

Timken® Torrington® hydraulic nuts have been designed to install and remove tapered bore bearings with minimal effort. The use of hydraulic nuts allows for better control of the bearing internal clearance reduction without damaging the bearing or other components. Also, the hydraulic nut will considerably reduce the downtime during installation or removal of tapered bore bearings.

DESCRIPTION

The Torrington hydraulic nut consists of an internally threaded ring and an externally threaded ring with two o-ring seals.

All hydraulic nuts are supplied with:

- Quick connection fittings (external thread ¼" B.S.P. and internal thread ¾" N.P.T.)
- Two pipe plugs 1/4" B.S.P.
- One set of spare o-rings.

INSTRUCTIONS

When the hydraulic nut is used, the piston must be in the innermost position. For this operation, please ensure that the valve of the hydraulic hose is disconnected from the nut so that the nut is not under pressure.

To contract the piston inside the internally threaded ring, insert a rod bar in one of the four drilled holes located on the outside diameter of the internally threaded ring. Screw the hydraulic nut on the thread with the piston in contact with the surface until the groove machined on the outside diameter of the piston near the outboard face is level with the face of the internally threaded ring.

One of the two threaded holes must be plugged with the ¼" B.S.P. pipe plug before the hydraulic nut is pressurized. The maximum pressure permissible in the hydraulic nut is 14,000 psi (100 Kpa). The oil viscosity recommended is 1,400 **SUS** (300 cst) at operating temperature, (SAE 90 oil). To avoid over extension of the piston, a second groove has been machined on the outside diameter of the piston inboard of the one used to judge contraction. When this second groove is level with the face of the internally threaded ring, the piston has reached its length of travel as shown on the tables. If the second groove of the piston travels past the face of the internally threaded ring, the piston will not be correctly guided inside the threaded ring and the hydraulic nut can be damaged.

Should the oil start to leak from the piston area, it is certain that the o-ring seals are damaged or worn and need to be replaced.

When the hydraulic nut is not in use, ensure that the threaded holes are plugged to prevent the entry of contaminants in the piston cavity. To preserve against corrosion during storage, apply a coat of light oil on the hydraulic nut surfaces.

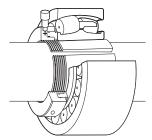

ORDERING COMPONENTS

Contact your local Timken Sales office or nearest authorized Timken bearing distributor for ordering Torrington hydraulic nut systems.

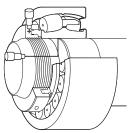

ENGINEERING SERVICES

Special applications should be referred to a Timken Sales Engineer for recommendations.

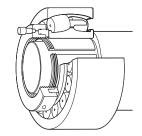

Installation

Hydraulic nut used to mount the bearing on a pull type sleeve.

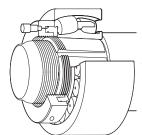

Hydraulic nut used to mount the bearing on tapered journal.

Hydraulic nut used to mount the bearing on a push type adapter sleeve.

Removal

Hydraulic nut used to withdraw a push type adapter sleeve.

For your nearest Timken sales representative, call (800) 223-1954. Outside the U.S. and Canada, call (330) 438-3000.
